Potato - Healthy / no target disease detected

RAG record ADV-012 | canonical key: potato_healthy

Record ID	ADV-012
Crop / crop key	Potato / potato
Condition / disease key	Healthy / no target disease detected / healthy
Main pathogen	Not applicable
RAG aliases	potato healthy, no target disease

Farmer quick guide: treatments protect healthy plant tissue and slow disease spread. Dead or badly damaged leaf tissue will not become green again.

How to recognize it

- The uploaded image does not show a strong visual match to the target disease classes used by the classifier.
- Leaves should still be checked for insects, nutrient deficiency, drought/heat injury and diseases that are outside the model classes.

Weather or field conditions that favour it

Not applicable. A healthy prediction is a classifier result, not a guarantee that the whole crop is disease-free.

What to do now

- Do not apply a fungicide only because an image was uploaded.
- Continue normal field scouting and inspect several plants, not only one leaf.
- If symptoms develop or yield is affected, take new photos and seek local KVK/extension or laboratory confirmation.

Chemical treatment - only after the disease is confirmed

No chemical treatment is recommended from a healthy/no-target-disease prediction. Do not spray a fungicide without a confirmed target disease.

Safety and compliance: Use only a product whose current Indian label allows the crop and target disease. Follow the label rate, water volume, re-entry interval and pre-harvest interval. Wear label-required PPE. Do not mix products unless the label or a qualified extension adviser permits it.

Prevention and integrated management

- Use clean planting material and locally recommended varieties.
- Keep balanced nutrition and irrigation.
- Maintain field sanitation and monitor regularly.
- Use pesticides only when a pest/disease is identified and the product label permits that crop and target.

RAG guardrail

The AI should treat the chemical table as source-grounded examples, not permission to invent a different pesticide or dose. If the retrieved source does not match the crop, disease and formulation, return non-chemical advice and request local verification.

Sources used for this record

Healthy-state guidance is a conservative system rule: no disease-specific pesticide is recommended when the classifier finds no target disease. For field decisions, use local KVK/SAU guidance and the current product label.
